

ABSTRACT OF THE DISCLOSURE (Revised)

A makeup mirror unit includes a pair of sub mirrors and a pair of rack portions. In order to take goods from the rack portions, the sub mirrors are rotated inwardly around shafts of first hinges. In order to match the sub mirrors together, the sub mirrors are rotated toward the front side together with the frames around shafts of second hinges which are attached opposite with respect to the first hinges. When the left and right sub mirrors are opened, and the side ends of the sub mirrors are adjacent with respect to each other in a state where the left and right sub mirrors are positioned in the front center portion of the makeup mirror unit, by connecting the magnet and the magnet receiver to each other, the sub mirrors can easily be connected in the center to be in the same plane.
